Learning Keys

Key 1

No Maths
brain

Maths
brain

No Maths
brain

This is not how it works

What happens when we learn?

We are not born with these pathways

- In 1st grade parents were told he was “learning disabled” “had a very low IQ”
- “The worst child teachers had seen in 20 years”
- Graduated in 2018 with a doctorate in Applied Mathematics from Oxford University.
- His mother (Lois Lechford) authored: *Reversed: A Memoir*

Nicholas Lechford

Key 2:

Evidence of the importance of
times of struggle

Clear evidence from
neuroscience &
education

Embracing Struggle

For learners – it is freeing, they keep going when they struggle, it breeds persistence

When learners say “this is hard” – I say, “great that is the feeling of your brain working hard”

Adults go into meetings differently

www.sciencenewsforstudents.org/article/secret-science-mistakes-boost-understanding

PSYCHOLOGY

A secret of science: Mistakes boost understanding

Failure can change how you learn — and propel you toward success

Many kids fear making a mistake will label them as a failure. In fact, science is built on a mountain of mistakes, many made by the greatest minds. The trick is to view each mistake as a step along the path to understanding something better.

You should
want to learn
and work at
the edge of
your
understanding

Jo Boaler, Mathish

Encouraging Struggle

Encouraging Struggle – Jennifer Schaefer

“Ms Schaefer I am really in the pit”

“Excellent - what classroom tools do you need?”

Key 3: Mindset

Letting go of Limits

Developing a growth mindset –
believing that you can achieve

Extensive

Conducted
with all
age ranges

Improves
learning,
health,
aggression

Mindset Evidence

Changing mindset

It is a journey not a switch

Once people become aware of the science, change starts to take place.

What happens when students change their mindsets?

Online class – English –
Spanish - Portuguese
½ million people have
taken it

- Randomized Controlled Trial
- Middle school teachers who taught 2 classes gave it to one of their classes, (10 schools, 4 districts, 1090 students)
- At the end of the school year the students who took the class achieved at significantly higher levels on mathematics standardized tests (SBAC) & Math GPA.
- During the school year the students who took the class were 68% more engaged in math class.
- *Boaler, Dieckmann, Pérez-Núñez, Sun & Williams, 2018*

Key 4. Engage with content with a lens of multiplicity – valuing different ways of thinking & seeing content

Multiple Brain Pathways

When we work mathematically different areas of the brain light up and communicate, including 2 visual pathways – the ventral and dorsal pathways.

Menon, V. (2015) Salience Network in Arthur Toga
Brain Mapping: An Encyclopedic Reference

The most powerful brains are interconnected

Numbers, words, pictures, graphs, algorithms, tables, models, movement

Changing questions in maths class so that there is :

Opening up
maths

- Space inside them to learn
- Opportunities for brain connections

fractions $1 \div 2/3$

Fixed Maths

What is the answer?

Growth Maths

“You may know a rule but I don’t care about the rule today” Cathy Humphreys

You need to make sense of your answer

Show your thinking visually

The task now has space inside it for learning

Reasoning is the essence of mathematics

Encouraging
collaboration

Convince a skeptic

Convince a friend

Convince yourself

Josh's proof

Prove It to Me!

Engage your learners through tasks proven to significantly promote reasoning and problem solving, which touch on many of the Mathematics Teaching Practices in *Principles to Actions: Ensuring Mathematical Success for All*. These tasks are discussed in this article, another installment in the series.

Jo Boaler

Reasoning and problem solving are both critical acts in mathematics learning. I have met many teachers who tell me they would love to highlight them more but feel they cannot because of the pressures of content coverage, pacing guides, and district tests. In this article, I describe a teaching intervention that highlighted problem solving and reasoning and resulted in changed mathematics pathways for students, whether they were at the low, middle, or high end of the achievement spectrum. Two summers ago, my Stanford youcubed team and I invited 81 middle school students to the Stanford campus to learn mathematics differently. I knew from many research studies that students would be helped if they were actively engaged in mathematics, solving creative and rich problems, and if they believed in their potential (Boaler 2016; 2015). I did not, however, expect the huge positive change the students made in their achievement, their beliefs about themselves, and their relationship with mathematics.

STRUCTURE OF THE YOUNCUBED SUMMER CAMP

In preparation for the youcubed summer camp, I asked district math leaders if they could find students who had developed negative ideas about themselves and about math. They assured me that they could and sent the details of the camp to teachers

Rectangle Area

Fixed:

What is the area of an 8 x 3 rectangle?

Growth: what rectangles have an area of 24?

Work this out in your head, with no
paper and pencil:

$$18 \times 5$$

$$\begin{array}{r} 4 \\ 18 \\ \times 5 \\ \hline \end{array}$$

$$\begin{array}{r} 19 \\ 63 \overline{) 82} \end{array}$$

$$\begin{array}{r} 75 \\ - 32 \\ \hline \end{array}$$

$$20 \times 5 = 100$$

$$2 \times 5 = 10$$

$$100 - 10 = 90$$

$$10 \times 5 = 50$$

$$8 \times 5 = 40$$

$$50 + 40 = 90$$

$$9 \times 5 = 45$$

$$9 \times 5 = 45$$

$$45 + 45 = 90$$

$$18 \times 2 = 36$$

$$18 \times 2 = 36$$

$$18 \times 1 = 18$$

$$36 + 36 + 18 = 90$$

$$18 \times 5 = 9 \times 10$$

Key 5. Flexibility & Depth – over speed

Dissociating Mathematics from Speed

"I was always deeply uncertain about my own intellectual capacity; I thought I was unintelligent. And it is true that I was, and still am, rather slow. I need time to seize things because I always need to understand them fully. Towards the end of the eleventh grade, I secretly thought of myself as stupid. I worried about this for a long time.

I'm still just as slow. (...)At the end of the eleventh grade, I took the measure of the situation, and came to the conclusion that rapidity doesn't have a precise relation to intelligence. **What is important is to deeply understand things and their relations to each other. This is where intelligence lies. The fact of being quick or slow isn't really relevant."**

Lauren Schwartz,
Fields Medal Winning
Mathematician

MULTIPLICATION!

Calc Student reflection

I feel as though my relationship with maths has slowly shifted from abusive to healthy over the past month. I know that we still have a ways to go, but maths and I are on the "right track". I feel like I am now able to see the light at the end of the tunnel so to speak. This course gave maths and me a chance to really sit down and understand each other. (Final Reflection)

Mathematical Mindset Algebra

This 4-week curriculum unit we have developed is one that can be used to introduce algebraic concepts at any grade level. It draws upon algebraic research showing that it is more helpful for students to learn algebra through studying pattern growth where a variable represents a case number, and can vary, before learning about "solving for x ." When students start learning algebra by solving for x they come to believe that a variable stands for a single number and does not vary. Later when they need to understand that variables can vary, they meet a conceptual barrier, and many do not ever get past that barrier. We recommend that students learn first about pattern growth and see that algebra can be useful for describing growth. Later, when they encounter situations when the variable stands for one missing number, they see this as a subset of their broader learning about variables and there is no confusion.

Choose Your Dream team!

Your job is to choose your dream team of five players containing 2 guards and 3 forwards. Justify your choice of each player using graph tools, statistics and explanations. If there is time you may want to choose bench players too.

- Go to this [link](#) to find the data in CODAP. [Here](#) is a key to the data set.
- Find your group slides in the class slides and make a “poster”.
 - Describe your findings with words and graphs. Include the mean and median for your data.

Be prepared to present your team and give arguments for why your team would win.

A Data Investigation!

Maths in the world and in classrooms

Our focus is out of balance

2 modes of thinking – detailed & big picture - We need to learn to move fluidly between the 2

Dixon, M. L., De La Vega, A., Mills, C., Andrews-Hanna, J., Spreng, R. N., Cole, M. W., & Christoff, K. (2018). Heterogeneity within the frontoparietal control network and its relationship to the default and dorsal attention networks. *Proceedings of the National Academy of Sciences*, 115(7), E1598-E1607.

When we move between ish and precise thinking

It activates different brain regions

The frontoparietal control network – A and B

Calculate it

$$\begin{array}{r} 280 \div 9 \\ 9 \overline{) 280.000} \\ \underline{27} \\ 10 \\ \underline{9} \\ 10 \\ \underline{9} \\ 10 \\ \underline{9} \\ 1 \end{array}$$

For example:
280 divided by 9

Ish it 😊:

To ish you need a sense of the numbers
You need **number sense**!

Teacher reflection

I am starting to feel sad about young and older students that when asked to divide 272 by 8 mentally, they will try and do long division, without a real feel for whether the answer makes sense or not, inside their heads. Same for adding or subtracting mixed numbers. When asked to add $19\frac{3}{4} + 27\frac{1}{3}$ many students change these into improper fractions with a common denominator. These students will lose most sense of the numbers on the way. Is it that we don't take enough time for teaching true understanding? Is there not enough time for instilling joy of number sense and logical thinking?

Suzanne Dawson in our youcubed facebook group

Ask students to work out the ish number first

It will help them think conceptually and develop number sense

It is not just numbers that we can ish:

- Plotting Plot $f(x+3)$?
- What do you think it will look like?
- What do you think will happen?
- Small but transformative questions, that cause a pull back in thinking
- Gives access to deeper meaning

Ishing or estimating?

- Ishing is estimating but different
- When we ask students to estimate they think it is yet another method
- When we ask students to come up with ish numbers they think more freely, they lean in & engage

Ish-ing helps with standardized tests

$$\frac{12}{13} + \frac{7}{8}$$

1

2

19

21

Most common answer: 19

Followed by 21

NAEP: Only 24% of 13-year-olds and 37% percent of 17-year-olds answered the question correctly.

Ishing helps with maths achievement!

Elementary students' ability to estimate, particularly magnitude, **predicts formal mathematics achievement across the grades** (Schneider et al., 2018).

Siegler et al. (2011) found that students' ability to estimate magnitudes on number lines, foundational for students' understanding of arithmetic and fractions, **was an independent predictor of mathematics achievement-test scores all the way up to age 14.**

Schneider, M., Merz, S., Stricker, J., De Smedt, B., Torbeyns, J., Verschaffel, L., & Luwel, K. (2018). Associations of number line estimation with mathematical competence: A meta-analysis. *Child Development*, 89(5), 1467-1484.

Siegler, R., Thompson, C., & Schneider, M (2011). An Integrated Theory of Whole Number and Fractions Development. *Cognitive Psychology*, 62, 273-296.

I am not saying:

- That precision is not important

- I am saying we need both – they need to be in balance

- b) 29 feet
- c) 32 feet
- d) 85 feet

- a) 60
- b) 90
- c) 120
- d) 150

Sum of the
35 dice?

From a conference attendee

I was at the CMC North Conference in Asilomar this past weekend and I sat in on your Math -ish presentation. I was able to teach my students about -ish numbers and we used it yesterday in class. I teach 6th grade and we are working on finding the unit price.

I had the students find an -ish number for the unit price before I gave them a calculator to do the calculations.

Even my less confident students were getting involved in the conversation and when we did calculate it the students could see their -ish answer was close and if it was not they talked about why it was not close. I was amazed at how much conversation I got out of the students!

Today while they were working I heard students helping each other and to start they were asking "what is your -ish number?".

REFLECTION!

Write your answers in the blank spaces below!

What mathematical ideas/concepts did you learn today?

How is the idea you learned today related to others you have learned?

What opportunities did you get to struggle?
How did that feel?

How could you use the mathematical concept in your life?

What different strategies or approaches to the problems were helpful to you?

Are there areas that you do not understand and would like more opportunities to learn?

Can you write your own problem for someone else to try to solve?

Flip your paper over and give it a try on the back!
